REMSOFT

Leveraging the Power of Optimization

With hundreds of clients around the globe, Remsoft is the world leader in advanced analytics solutions for sustainable forest planning.

THE OPTIMAL SOLUTION
for maximizing net revenue, product mix, allocation of resources—across all asset classes.

A STRATEGIC PLAN TO
meet your objectives, while allowing for operational constraints.

REPORTS ON ALL ASPECTS
of the plan—costs, revenues, volumes, etc.—providing complete transparency into the process, managing risk and driving accountability.

SCENARIO & TRADE-OFF
analyses to help identify areas of sensitivity or weakness, and explore different policy alternatives.

For over a decade forest managers have depended on Remsoft software to develop intelligent, transparent and defensible plans that balance conflicting criteria, meet certification requirements and meet company objectives.

Our newest technology offers executives, managers and operational foresters the right level of access to the model so they can view and work with the results, provide feedback, and quickly identify and correct issues as they arise. The end result is a tighter, more collaborative connection between strategic and operational planning.

Valuation & Investment Planning

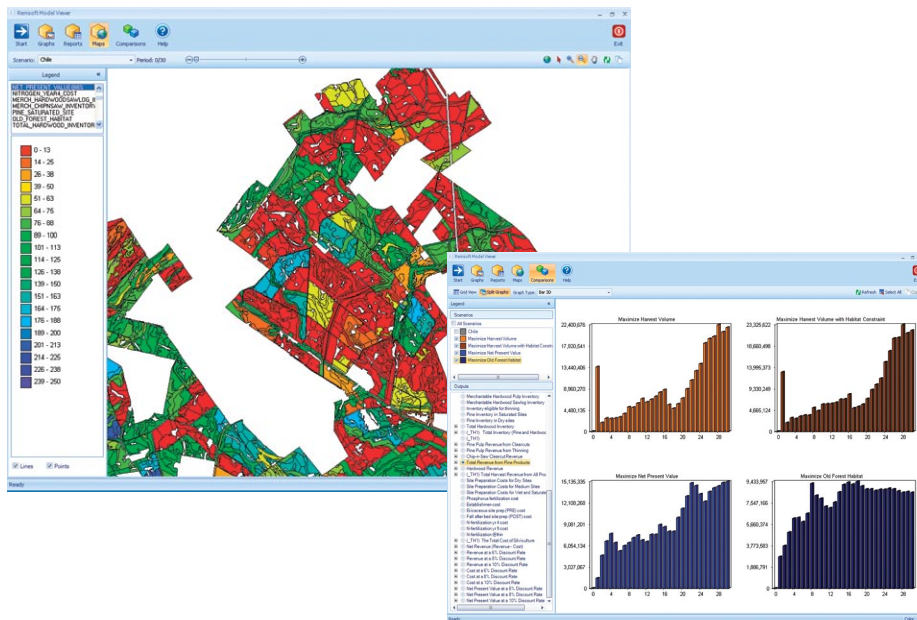

If you are looking to maximize the value of your assets, static spreadsheets are limited. Remsoft Analytics is intelligent, true-optimization technology that can address multiple criteria across asset classes and give you the big-picture, long, medium and short term perspectives all while minimizing uncertainty.

Certification & Compliance

The world is watching what you do. Can you justify your decisions? Can you show the environmental sustainability of your initiatives? Remsoft Analytics enables you to make the best possible choices, balance competing criteria and clearly demonstrate your plans and their impacts.

Carbon Sequestration

Carbon has added new value to your resources, but how do you accurately assess its worth? Remsoft Analytics' core strength in complex analysis has made it an early leader in carbon sequestration analysis: determining value, performing trade-off analysis and charting the best way forward.

Applications & Benefits

- Balancing investment, timber, carbon, mining and conservation values
- Maximizing returns across assets
- Optimizing investment criteria for multiple stakeholders
- Investing for climate change and ecosystems
- Risk mitigation including global geographic diversity
- Data completeness, security and integrity
